Centrifugal Force Juicer

A centrifugal juicer, also known as a fast juicer, is the most popular type of home juicer. The biggest selling point is the fact that they are a cheap juicer to buy.

Pros

They are fastest at extracting juice from fruits and vegetables, especially if you have one with a tube that is wide enough to take on whole small apples, cucumbers, or oranges

They stand upright so they take up minimal space on your kitchen counter. They tend to be the least expensive juicers since they are cheap to make

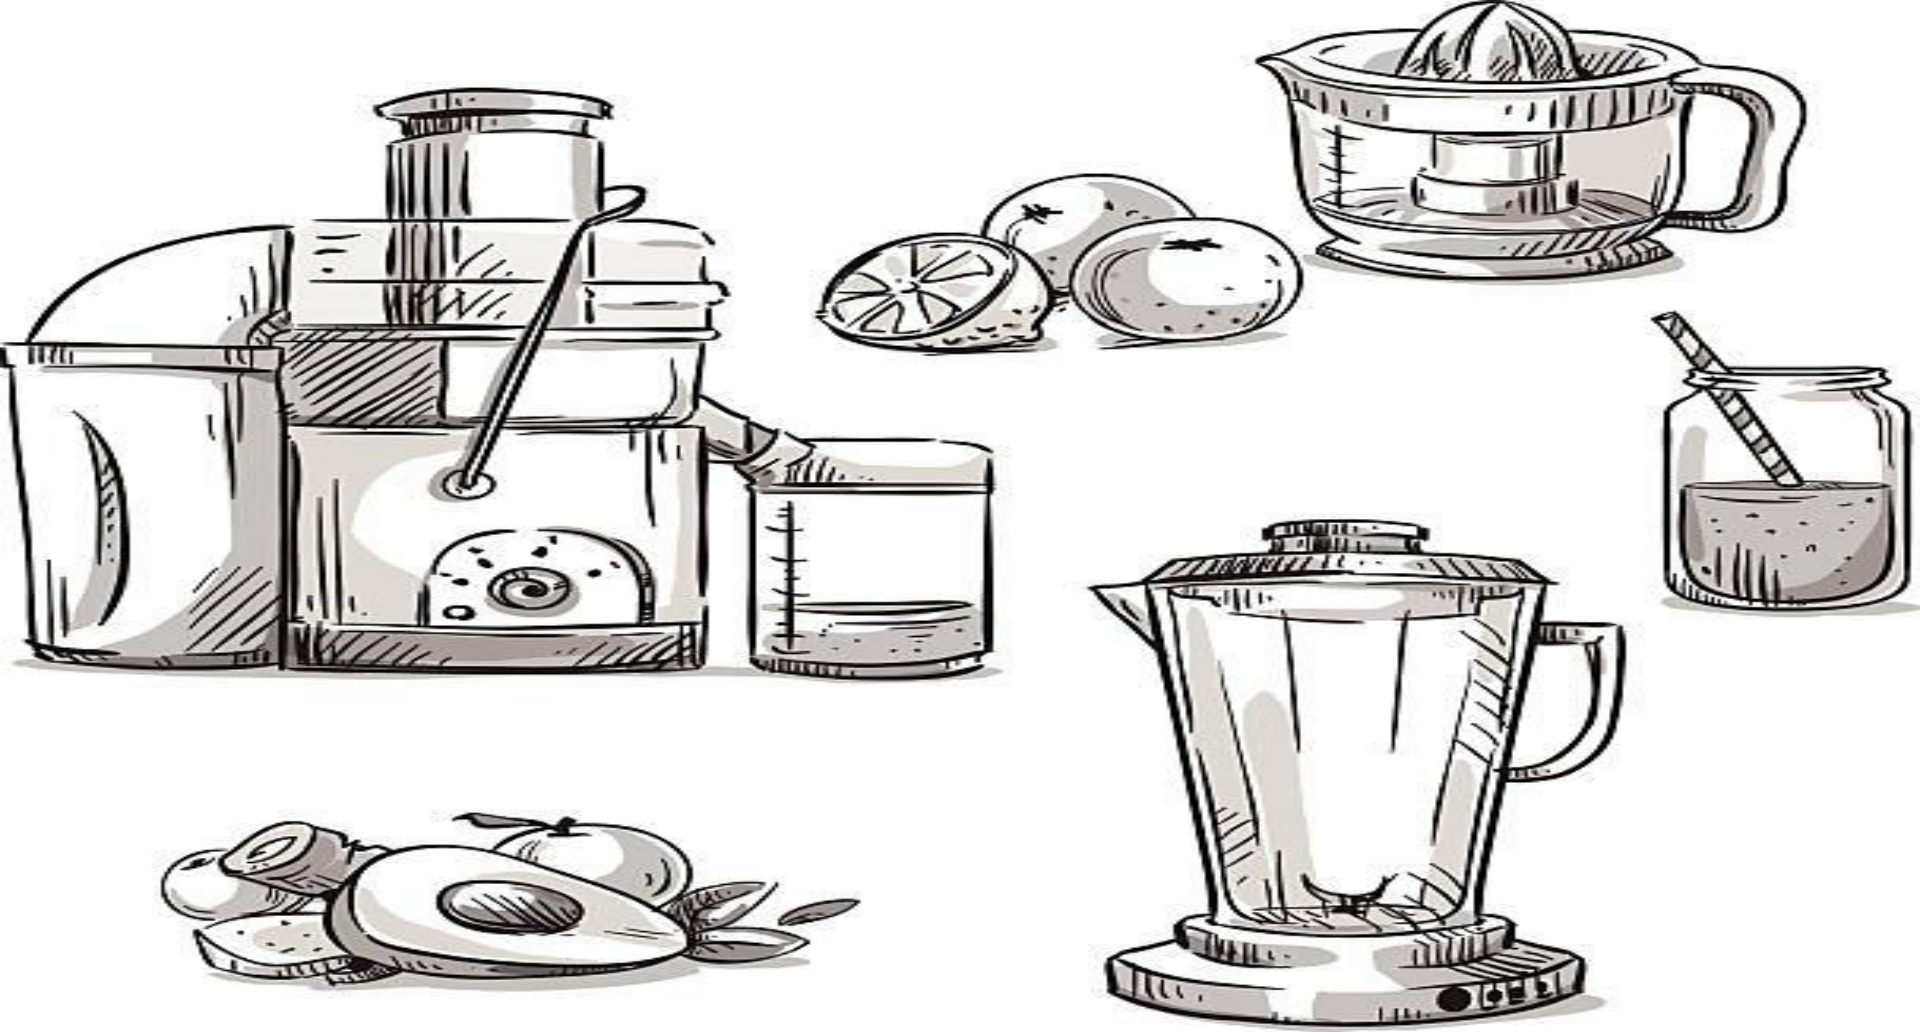
Cons

The speed of rotation causes heat that degrades the quality of juice produced

More oxidation takes place, creating a foam on top of the fresh juice and causing it to separate quickly

They can be quite noisy

They don’t handle leafy greens or wheatgrass very well



Masticating Juicer

Masticating juicers are also known as the slow juicers. They use a slow auger (gear) to crush fruits and veggies and force against and through a sharp screen at 80 to 100 RPM. The juice is a pulpy, foamy product that can be bitter to taste and has a thick and chunky mouth-feel. Many brands of masticating juicers market them as “cold-pressed”, while they don’t actually contain a press at all.
